

Definition: Span

Definition: Span

Let V be a [Vector Space](#) over a field F , and let $S = \{\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_k\} \subseteq V$ be a set of vectors. The **span** of S , denoted $\text{span}(S)$, is the set of all linear combinations of vectors in S :

$$\text{span}(S) = \left\{ \sum_{i=1}^k a_i \mathbf{v}_i : a_i \in F \right\}$$

Alternative Notation

The span is also commonly denoted as: - $\langle S \rangle$ or $\langle \mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_k \rangle$ - $L(S)$ (for “linear span”) - $\text{Lin}(S)$

Properties

1. **Subspace:** $\text{span}(S)$ is always a subspace of V
2. **Smallest containing subspace:** $\text{span}(S)$ is the smallest subspace of V that contains S
3. **Closure under linear combinations:** If $\mathbf{u}, \mathbf{w} \in \text{span}(S)$ and $a, b \in F$, then $a\mathbf{u} + b\mathbf{w} \in \text{span}(S)$

Special Cases

- $\text{span}(\emptyset) = \{\mathbf{0}\}$ (the zero subspace)
- $\text{span}(\{\mathbf{v}\}) = \{a\mathbf{v} : a \in F\}$ (the line through \mathbf{v})
- If S spans V , we say S is a **spanning set** or **generating set** for V

Infinite Sets

For an infinite set $S \subseteq V$, the span consists of all *finite* linear combinations:

$$\text{span}(S) = \left\{ \sum_{i=1}^n a_i \mathbf{v}_i : n \in \mathbb{N}, \mathbf{v}_i \in S, a_i \in F \right\}$$

The concept of span connects individual vectors to the subspaces they generate.
