

Definition: Topological Space

Definition: Topological Space

A **topological space** is a **Set** X together with a collection τ of subsets of X satisfying the following axioms:

Axioms for a Topology

The collection τ must satisfy:

1. **Empty set and whole space:** $\emptyset \in \tau$ and $X \in \tau$
2. **Arbitrary unions:** If $\{U_i\}_{i \in I}$ is any collection of sets in τ , then

$$\bigcup_{i \in I} U_i \in \tau$$

3. **Finite intersections:** If $U_1, U_2, \dots, U_n \in \tau$, then

$$\bigcap_{i=1}^n U_i \in \tau$$

Terminology

- The collection τ is called a **topology** on X
- The sets in τ are called **open sets**
- The pair (X, τ) is called a **topological space**
- When the topology is clear from context, we may simply refer to “the topological space X ”

Examples

1. **Discrete topology:** $\tau = \mathcal{P}(X)$ (all subsets are open)
2. **Indiscrete topology:** $\tau = \{\emptyset, X\}$ (only the empty set and X are open)
3. **Standard topology on \mathbb{R} :** Open sets are unions of open intervals

Properties

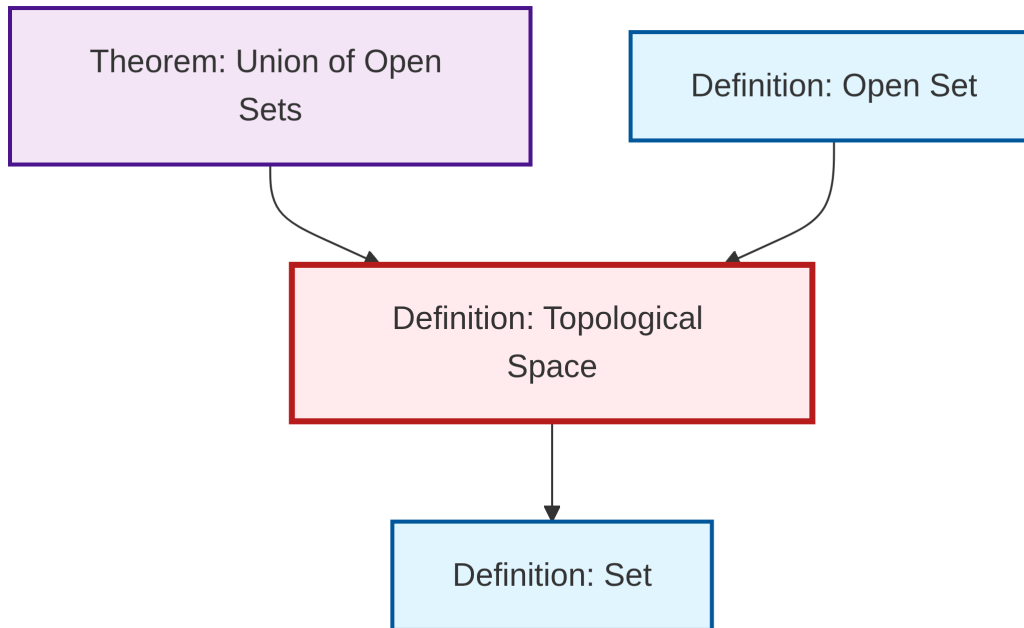

Key properties that follow from these axioms:

- The union of any collection of open sets is open
- The intersection of finitely many open sets is open
- Complements of open sets are called **closed sets**
