# Example: Real Line with Standard Metric

## Example: Real Line with Standard Metric

The real numbers $\mathbb{R}$ with the standard metric form one of the most fundamental examples of a Metric Space.

### Definition

The **standard metric** on $\mathbb{R}$ is defined by:

$$d(x, y) = |x - y|$$

for all $x, y \in \mathbb{R}$, where $|x - y|$ denotes the absolute value of $x - y$.

### Verification of Metric Axioms

We verify that $d$ satisfies all four metric axioms:

1. **Non-negativity**: Since absolute value is always non-negative, $d(x, y) = |x - y| \geq 0$ for all $x, y \in \mathbb{R}$.
2. **Identity of indiscernibles**:
   - If $x = y$, then $d(x, y) = |x - y| = |0| = 0$
   - If $d(x, y) = 0$, then $|x - y| = 0$, which implies $x - y = 0$, so $x = y$
3. **Symmetry**: $d(x, y) = |x - y| = |-(y - x)| = |y - x| = d(y, x)$
4. **Triangle inequality**: For any $x, y, z \in \mathbb{R}$:

$$d(x, z) = |x - z| = |(x - y) + (y - z)| \leq |x - y| + |y - z| = d(x, y) + d(y, z)$$

### Open Balls

In this metric space, the open ball $B(a, r)$ centered at $a$ with radius $r > 0$ is:

$$B(a, r) = \{x \in \mathbb{R} : |x - a| < r\} = (a - r, a + r)$$

This is simply the open interval of length $2r$ centered at $a$.

### Properties

- The metric topology induced by $d$ is the standard topology on $\mathbb{R}$
- $(\mathbb{R}, d)$ is a **complete metric space**: every Cauchy sequence converges
- The space is **separable**: the rationals $\mathbb{Q}$ form a countable dense subset
- It is **connected** but not **compact**
